## PHYSICIAN PROGRESS NOTE

|                |                                                       |           |                       |
|----------------|-------------------------------------------------------|-----------|-----------------------|
| Date of Visit: | 01/20/2026                                            | Provider: | Dr. Elena Vasquez, MD |
| Patient:       | Marcus Webb                                           | DOB:      | 03/15/1968            |
| Diagnosis:     | D83.9 — Common Variable Immunodeficiency, unspecified |           |                       |

### SUBJECTIVE

Mr. Webb is a 57-year-old male with a history of recurrent sinopulmonary infections presenting for follow-up. He reports his fourth respiratory infection in 12 months, responding to antibiotics but with delayed recovery. He denies fever today. No new complaints. He is agreeable to initiating home IVIG infusion therapy.

### OBJECTIVE

Vitals: BP 128/78, HR 72, Temp 98.4°F, SpO2 98% on room air.  
General: Alert, oriented, in no acute distress.  
Respiratory: Clear to auscultation bilaterally. No wheezes or crackles.  
IgG (09/29/2025): 285 mg/dL — markedly below normal range (700–1600 mg/dL).

### ASSESSMENT

Common Variable Immunodeficiency (CVID), ICD-10 D83.9. Confirmed hypogammaglobulinemia with IgG 285 mg/dL on 09/29/2025. Recurrent infections consistent with inadequate humoral immunity despite prophylactic antibiotic therapy.

### PLAN

1. Initiate IVIG replacement therapy: 40 grams IV every 28 days via home infusion.
2. Target IgG trough level  $\geq$  700 mg/dL; recheck IgG 4 weeks after first infusion.
3. Prior authorization to be submitted by CareIG Specialty Pharmacy.
4. Patient counseled on procedure, risks, and benefits. Questions answered. Patient consents.
5. Continue monitoring for adverse effects; follow up in 3 months or sooner if needed.
